Topic	Sound	
Class Description	Students decompose the Wireless Quiz Buzzer project into smaller problems. They learn how to play sound in the React Native environment. Students design a rounded buzzer button which when clicked plays the buzzer sound.	
Class	C55	
Class time	45 mins	
Goal	 Decompose the wireless quiz buzzer project intertasks. Play sound when a button is clicked in the react environment. Design a rounded buzzer button which when clibuzzer sound. 	t native
Resources Required	 Teacher Resources Laptop with internet connectivity Earphones with mic Notebook and pen Android/iOS Smartphone with Expo App Expo Snack Login 	installed

CONTEXT

• Introduce the scope of the project.

Class Steps	Teacher Action	Student Action	
Step 1: Warm Up (5 mins)	Ahh! Here we are again! Remember what we will be working on in this class?	ESR: Wireless Quiz Buzzer App	
	Awesome! But before we get started, let's quickly recall what we covered in the last class? Help the student recall points when he/she is stuck.	ESR: - We learned about props of a component We learned to design a prop for a custom component We learned to perform an action (through a function) when a button is pressed. We displayed an alert box when a button was pressed We worked on a problem statement about a quiz buzzer app and we designed the wireframe for the app.	
	Amazing. You seem to remember a great deal. Now let's quickly get started on working towards our quiz buzzer app.		
	Teacher Initiates Screen Share		
 <u>CHALLENGE</u> Breakdown the project into smaller tasks/problems. Play sound 'on click' of a button. 			
Step 2: Teacher-led Activity (15 min)	Before we start working on any project, what is the first thing that we do?	ESR: varied	

The first thing that we do when working on any complex project is to break it down into small/simpler tasks. Each task should be very specific and should deal with only one small part of the project.

By combining each of these simpler tasks together, you should get the complex project done. This is called decomposition.

Breaking down a complex programming project into smaller problems is a very important skill for any developer/coder. It makes thinking and working on any project of any complexity easier for a programmer.

Can you try to tell what is decomposition of a project in your own words?

(Help the student develop clarity about what decomposition is through his/her response)

ESR:

Decomposition is breaking down the complex task into smaller/simpler problems. This makes it easier to think and work on each problem.

Perfect!

And the skill of decomposition - like any other skill - comes with practicing breaking down bigger/complex problems.

Why don't you try breaking down the wireless quiz buzzer project into

ESR:

(allow the student time to think.)

List of tasks the student can come up with:

 Task1: Create a button which when pressed plays the sound of a buzzer.

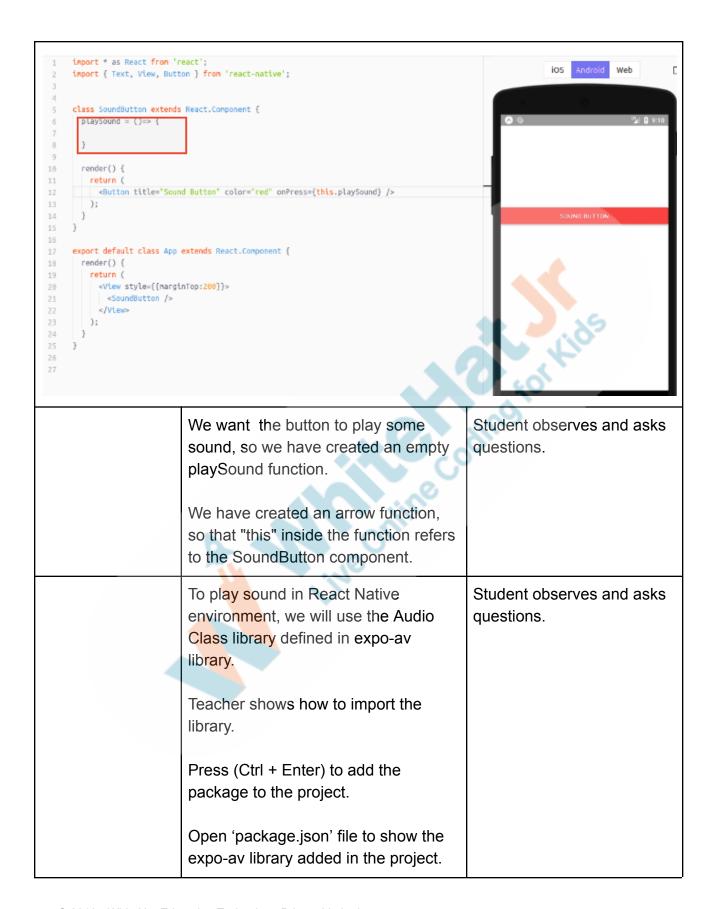

© 2018 - WhiteHat Education Technology Private Limited.

smaller simpler problems which we can solve? Perfect! This is a good start. So, let's attack Task 1. I am going to show you how to play sound in a react native environment.	 Task2: Create a home screen which allows the user to pick their team. Task 3: Navigate the user from the home screen to the buzzer screen. Task 4: Listen to which team is pressing the button first and store it in a database. Task 5: Display the teams in an order in which they pressed the buttons.
You can then go ahead and create a rounded quiz buzzer button which plays a buzzer sound when pressed. Cool?	ESR: Yes!
Teacher opens <u>Teacher Activity 1.</u> Can you look at the code here and tell me what this is doing?	ESR: We are creating a new component called 'SoundButton'. It has a red button inside it.
	We are rendering this SoundButton inside 'View' component inside the app.

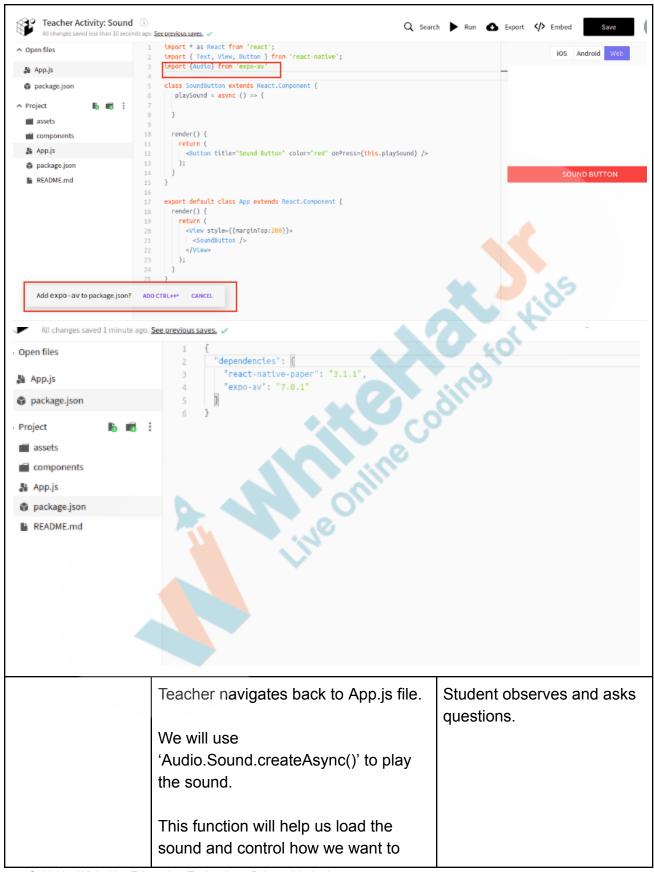

^{© 2018 -} WhiteHat Education Technology Private Limited.

button.

^{© 2018 -} WhiteHat Education Technology Private Limited.

play it. We will be exploring this more in our next project. For now, know that it accepts two objects - as json. One object defines the source of the file and the other object tells the status of the file.

We will be passing the url of the sound file we want to play in the first object and in the second object we will pass the shouldPlay status as true.

Also, remember Javascript is synchronous by default. But here we want to wait for the sound object to load and then play the sound.

We will attach 'await' before our instruction. To let the computer know that playSound is an asynchronous function now, we will add 'async' while defining it.

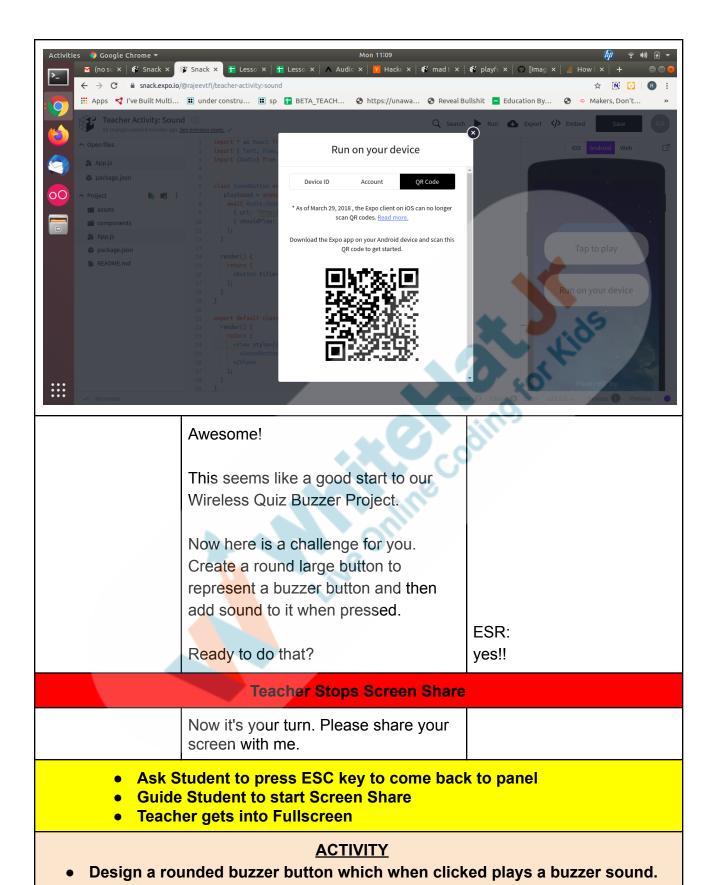

Now, let's open the project on our device and see the output.

Note: The sound might not play on the expo web because of the cross origin policy of the browser. Please test the app on the phone using an expo client.

Teacher scans the QR code on her android/iOS device and shows the output to the student.

The student scans the QR code on his/her android/iOS device and sees the output.

He/She presses the button to hear the buzzer sound.

© 2018 - WhiteHat Education Technology Private Limited.

Step 3: Student-Led Activity (15 min)	Guide the student to open Student Activity 1	Student opens Student Activity 1.
	You see, buttons were built mostly for the web and do not suit the app interface.	The student imports the 'TouchableOpacity' Component.
	We use another component for the app, which we call 'TouchableOpacity'.	He/She replaces Button with TouchableOpacity component with a Text component inside it.
	It is a component which responds when touched.	Kids
	Unlike Button, TouchableOpacity can enclose anything inside them - Text, View, etc.	ding for
	Guide the student to replace Button in the code with TouchableOpacity with a text inside it.	

```
import * as React from 'react';
                                                                                                     ios
                                                                                                          Andro
            import { Text, View, Button, TouchableOpacity } from 'react-native';
            class SoundButton extends React.Component {
5 E
              playSound = async () => {
              render() {
                 <TouchableOpacity>
                  <Text>Press Me</Text>
                 </TouchableOpacity>
                                                                                          Press Me
       14
       15
       16
       17
       18
            export default class App extends React.Component {
       19
             render() {
       20
                <View style={{marginTop:200}}>
                 <SoundButton />
                </View>
       24
              );
       26
       27
       28
                         What do you see?
                                                                          ESR:
                                                                          Only the Text "Press Me".
                         Yes! That is because
                         'TouchableOpacity' is transparent by
                         default. But you can add color to it
                         using the styles prop of the
                         component.
                         Guide the student to add color to the
                                                                          The student adds the
                         'TouchableOpacity'.
                                                                          'backgroundColor' property
                                                                          to 'TouchableOpacity' under
                                                                          the styles property.
```

```
import * as React from 'react';
                                                                                                 iOS Android Web
    import ( Text, View, Button, TouchableOpacity ) from 'react-native';
    class SoundButton extends React.Component {
      playSound = async () => {
      render() {
10
          <TouchableOpacity style={{
           backgroundColor: 'red'
           <Text>Press Me</Text>
14
          </TouchableOpacity>
16
17
18
19
    export default class App extends React.Component {
20
      render() {
       return (
         <View style={{marginTop:200}}>
          <SoundButton />
24
         </View>
       );
26
27
28
                           Now, go ahead and add more styles
                                                                                  The student adds more
                                                                                 styles to give the
                           to make this a rounded button.
                                                                                  'TouchableOpacity' the
                                                                                  appearance of a rounded
                                                                                  button.

 26
           </TouchableOpacity>
                                                                          ESR:
                        Now, do you see the advantage of
                        'TouchableOpacity' over Buttons?
                                                                          Yes!
                        Now add the sound to your
                                                                          The student imports Audio
                        'TouchableOpacity' using its 'onPress'
                                                                          from the expo-av library.
                        property.
                                                                          He/She writes the async
                        This is similar to Button.
                                                                          playSound function.
                        Guide the student wherever they get
                                                                          He/She calls the function
                                                                          with 'onPress' prop of the
                        stuck.
                                                                          'TouchableOpacity'.
```

```
import * as React from 'react';
     import { Text, View, Button, TouchableOpacity } from 'react-native';
     import (Audio) from 'expo-av';
     class SoundButton extends React.Component {
      playSound = async () => {
6
         await Audio.Sound.createAsync(
          { uri: 'http://soundbible.com/mp3/Buzzer-SoundBible.com-188422102.mp3' },
          { shouldPlay: true }
10
       );
       }
       render() {
14
       return (
          <TouchableOpacity
            style={{
              marginLeft: 100,
17
              borderWidth: 1,
18
              borderColor: 'rgba(0,0,0,0.2)',
19
              alignItems: 'center',
20
              justifyContent: 'center',
               width: 200,
              height: 200,
              backgroundColor: 'red',
24
              borderRadius: 100,
26
             }}
             onPress={this.playSound}>
28
             <Text
           style={{
```

Now run your code on your device and check the output

The student uses the expo client to scan the QR code and run the project on his/her device.

Teacher Guides Student to Stop Screen Share

FEEDBACK

- Encourage the student to play around with another component called TouchableOpacity which works exactly like a button.
- Encourage the student to make reflection notes in the markdown format.
- Complement the student for her/his effort in the class.

Awesome!	
We have solved the first task out of	
the different tasks we listed at the	
start of the day. And it was not that	ESR:
difficult - was it?	No!
	We have solved the first task out of the different tasks we listed at the start of the day. And it was not that

© 2018 - WhiteHat Education Technology Private Limited.

Great. Can you quickly recall what we learned in Today's class?	ESR: - We learned how to import external libraries We learned how to add sounds in the React Native environment We also learned how to use a component called 'TouchableOpacity' and style it.
In the next class we will attack the other problems. We will learn how to create a two screen app rather than a single screen app. Users will be able to choose their team and then navigate to the Buzzer button.	ding for kids
Are you excited about learning new stuff in the next class?	ESR: Yes!
You get a "hats off". Till next class then. See you. Bye!	Make sure you have given at least 2 Hats Off during the class for: Creatively Solved Activities Great Question Strong Concentration

Project Pointers and Cues (5 min)

*This Project will take only 30 mins to complete. Motivate students to try and finish it immediately after the class.

DJ AUDIO MIXER APP -STAGE 1

Goal of the Project:

In Class 55, you learned to play sound using the expo-av library and designed a buzzer button. In this project, you will apply what you have learned in the class to complete the DJ mixer app and add code to stop a sound when the Sound button is pressed.

Story:

Your cousin Shawn loves music and wants to become a Disc Jockey (DJ). He has started creating a DJ mixer app for him. So far he has designed the buttons for the app.

Now you need to add code for stopping the sound whenever the stop button is pressed.

I am very excited to see your project solution and I know you both will do really well.

Bye Bye!
